## Welcome to integrator.io

This document describes how transformation rules are applied in the integrator.io environment. These rules will help you transform your record set or data for export or import using JavaScript Object Notation (JSON). The process is simple:

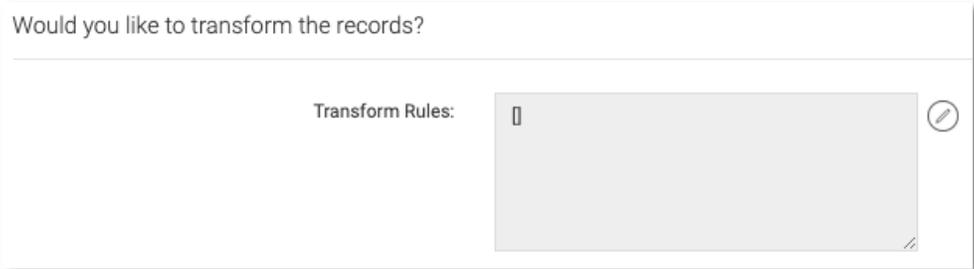

- Pre-Transformed Record
  - displays the raw data from the uploaded file and is the source file for the transformation.
- Transform Mappings
  - this is where you define the transformation rules which will map the Pre-Transform > Post-Transform data points.
- Post Transformed Record
  - displays the transformed record based on the mapping.

## Export | Import Rules

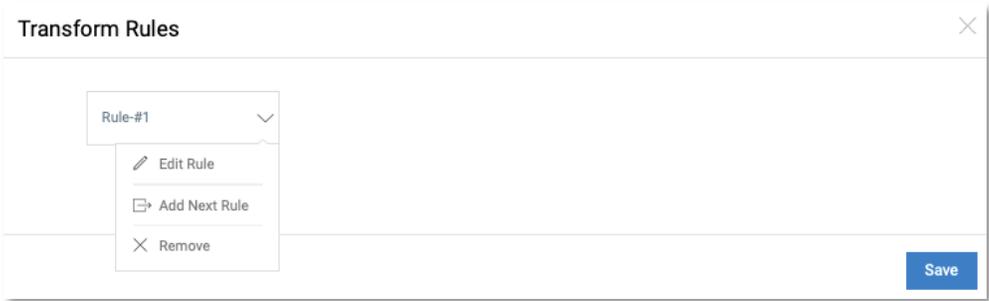

The integrator.io application allows modification of the format of your record in JSON format prior to export or import. From the Data Loader page, select "Create Flow", or the dropdown arrow next to the flow you want to transform, then click "Edit Flow".

To transform records, click the edit icon next to the Transform Rules field.

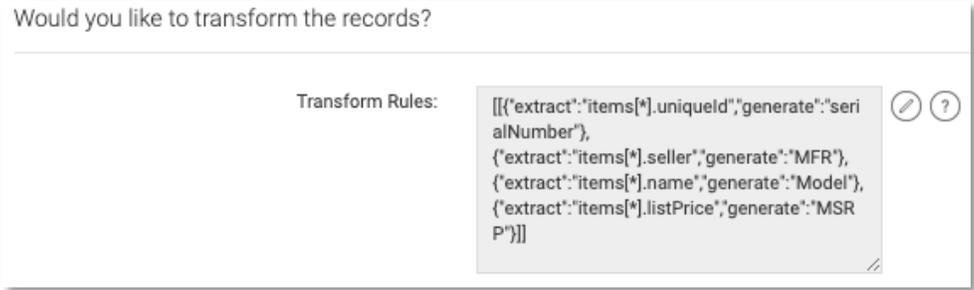

Select the rule to edit, or click [Rule #1] > [Edit Rule]

The following code sample shows the transformation process. Here, we have a record with some rather rigid database field names. These have been transformed into more industry-specific and business-friendly object names.

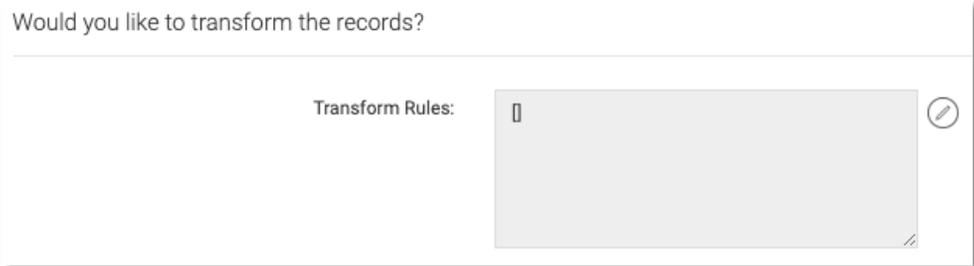

Pre-Transform	Transform Mappings	Post-Transform										
<pre>{   "emailTracked":   "kawasaki@yahoo.com",   "approvedBy": null,   "items": [     {       "uniqueId": "000001",       "seller": "Kawasaki",       "name": "ZX-6R",       "id": "ZX-6R",       "productId": "11111",       "refId": "100",       "whsePrice": 8999,       "listPrice": 9999,       "ean": null,       "lockId": "001",       "quantity": 1     }   ] }</pre>	<table border="1"> <thead> <tr> <th>Extract</th> <th>Generate</th> </tr> </thead> <tbody> <tr> <td>items[*].uniqueid</td> <td>serialNumber</td> </tr> <tr> <td>items[*].seller</td> <td>MFR</td> </tr> <tr> <td>items[*].name</td> <td>Model</td> </tr> <tr> <td>items[*].listPrice</td> <td>MSRP</td> </tr> </tbody> </table>	Extract	Generate	items[*].uniqueid	serialNumber	items[*].seller	MFR	items[*].name	Model	items[*].listPrice	MSRP	<pre>{   "serialNumber": "000001",   "MFR": "Kawasaki",   "Model": "ZX-6R",   "MSRP": 9999 }</pre>
Extract	Generate											
items[*].uniqueid	serialNumber											
items[*].seller	MFR											
items[*].name	Model											
items[*].listPrice	MSRP											

Click [Accept] and [Save]. The newly transformed record will now be displayed in the "Transform Rules" field on the main page.

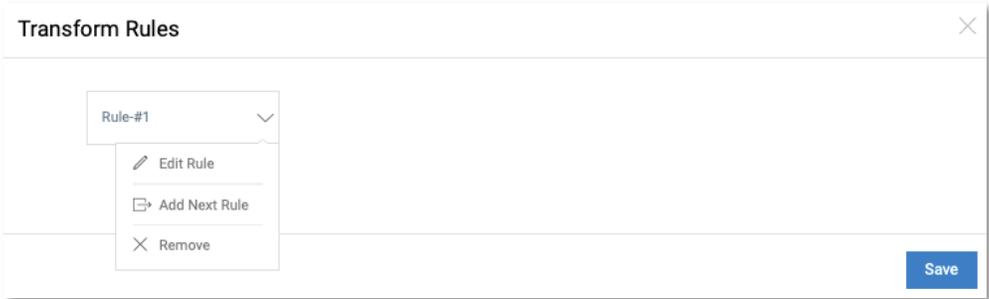

### Create a new transform rule

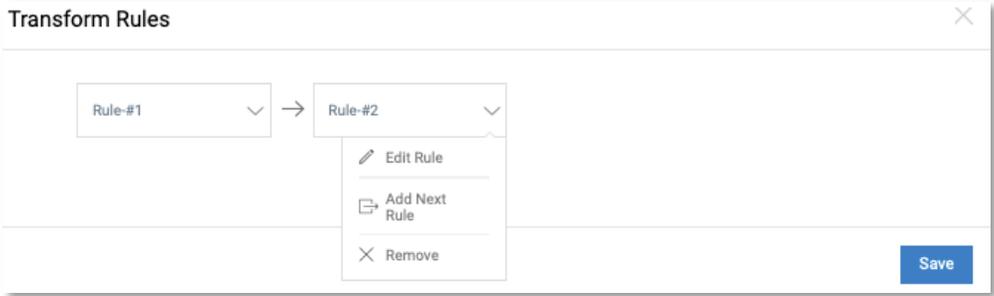

You can create multiple transformation rules which will first transform the existing record and apply a new set of rules. To do this, click the edit icon next to the Transform Rules field.

Click Rule #1 > Add Next Rule

The next transformation rule will populate to the right of the first.

Click "Edit rule" and perform the same steps to transform the field values from the example above to new values. In the example show below, the industry-specific and business-friendly object names have been transformed into dealer-specific database field names.

Pre-Transform	Transform Mappings	Post-Transform										
<pre>{   "serialNumber": "000002",   "MFR": "Kawasaki",   "Model": "ZX-2R",   "MSRP": 4999 }</pre>	<table border="1"> <thead> <tr> <th>Extract</th> <th>Generate</th> </tr> </thead> <tbody> <tr> <td>serialNumber</td> <td>bin</td> </tr> <tr> <td>MFR</td> <td>dealerSupplier</td> </tr> <tr> <td>Model</td> <td>modelNumber</td> </tr> <tr> <td>MSRP</td> <td>list</td> </tr> </tbody> </table>	Extract	Generate	serialNumber	bin	MFR	dealerSupplier	Model	modelNumber	MSRP	list	<pre>{   "bin": "000002",   "dealerSupplier": "Kawasaki",   "modelNumber": "ZX-2R",   "list": 4999 }</pre>
Extract	Generate											
serialNumber	bin											
MFR	dealerSupplier											
Model	modelNumber											
MSRP	list											

### Merging Fields

Fields may be merged also, creating a list of values from the arrays in the record. In the example below, the items 1,2,3 and the prices 10, 20, 30 have been transformed into a merged record of items and their relative prices.

Pre-Transform	Transform Mappings	Post-Transform						
<pre>{   "itemsNames": ["item1",   "item2", "item3"],   "prices": [10, 20, 30] }</pre>	<table border="1"> <thead> <tr> <th>Extract</th> <th>Generate</th> </tr> </thead> <tbody> <tr> <td>itemsNames[*]</td> <td>items[*].name</td> </tr> <tr> <td>prices[*]</td> <td>items[*].price</td> </tr> </tbody> </table>	Extract	Generate	itemsNames[*]	items[*].name	prices[*]	items[*].price	<pre>{   "items": [     {       "name": "item1",       "price": 10     },     {       "name": "item2",       "price": 20     },     {       "name": "item3",       "price": 30     }   ] }</pre>
Extract	Generate							
itemsNames[*]	items[*].name							
prices[*]	items[*].price							

# Single to Multiple Object Transformation

Multiple objects may be combined into a single record by repeating the parent node automatically.

Pre-Transform	Transform Mappings	Post-Transform								
<pre>{   "id": 100,   "products": [     {       "name": "product1",       "price": "10"     },     {       "name": "product2",       "price": "20"     },     {       "name": "product3",       "price": "30"     }   ] }</pre>	<table border="1"> <thead> <tr> <th>Extract</th> <th>Generate</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>*.id</td> </tr> <tr> <td>products[*].price</td> <td>*.price</td> </tr> <tr> <td>products[*].name</td> <td>*.name</td> </tr> </tbody> </table>	Extract	Generate	id	*.id	products[*].price	*.price	products[*].name	*.name	<pre>[   {     "price": "10",     "name": "product1",     "id": 100   },   {     "price": "20",     "name": "product2",     "id": 100   },   {     "price": "30",     "name": "product3",     "id": 100   } ]</pre>
Extract	Generate									
id	*.id									
products[*].price	*.price									
products[*].name	*.name									

# Delete Unwanted Fields

The following example demonstrates how to remove unwanted fields from an object. Here, the age and address fields have been removed for the record.

Pre-Transform	Transform Mappings	Post-Transform				
<pre>{   "name": "Estrella",   "age": 50,   "Address": "123 Anywhere St." }</pre>	<table border="1"> <thead> <tr> <th>Extract</th> <th>Generate</th> </tr> </thead> <tbody> <tr> <td>name</td> <td>name</td> </tr> </tbody> </table>	Extract	Generate	name	name	<pre>{   "name": "Estrella" }</pre>
Extract	Generate					
name	name					

## Array within an Array

This example shows how an array can be transformed within another array. Here, we have transformed "items" to "products".

Pre-Transform	Transform Mappings	Post-Transform												
<pre>{   "items": [{     "name" : "perfumes",     "price": 50,     "flavours": [{       "weight": 3.14,       "scent": "Obsession",       "color": "black"     } , {       "weight": 2.26 ,       "scent": "Cool Water",       "color": "blue"     }   ] }] }</pre>	<table border="1"><thead><tr><th>Extract</th><th>Generate</th></tr></thead><tbody><tr><td>items[*].name</td><td>products[*].name</td></tr><tr><td>items[*].price</td><td>products[*].price</td></tr><tr><td>items[*].flavours[*].weight</td><td>products[*].weight</td></tr><tr><td>items[*].flavours[*].scent</td><td>products[*].scent</td></tr><tr><td>items[*].flavours[*].color</td><td>products[*].color</td></tr></tbody></table>	Extract	Generate	items[*].name	products[*].name	items[*].price	products[*].price	items[*].flavours[*].weight	products[*].weight	items[*].flavours[*].scent	products[*].scent	items[*].flavours[*].color	products[*].color	<pre>{   "products": [     {       "weight": 3.14,       "scent": "Obsession",       "color": "black",       "name": "perfumes",       "price": 50     },     {       "weight": 2.26,       "scent": "Cool Water",       "color": "blue",       "name": "perfumes",       "price": 50     }   ] }</pre>
Extract	Generate													
items[*].name	products[*].name													
items[*].price	products[*].price													
items[*].flavours[*].weight	products[*].weight													
items[*].flavours[*].scent	products[*].scent													
items[*].flavours[*].color	products[*].color
